Open mHealth

Open mHealth is making patient-generated data accessible through an open data standard and community.

The Opportunity

≫ A number of standards relevant to sensor data integration already existed, but it was not easy to identify them.

The Resources

≫ DiMe's Library of Standards is an important tool to move forward the conversation about the need for standardization by showing relevant standards that already exist.

≫ Open mHealth has used the Landscape of Standards with the Library to show where existing standards apply in the data flow continuum, and how they relate to each other.

The Landscape of Standards has become an important element when presenting our standard-related work. It shows what standards already exist in this space and helps focus the conversation on implementation and expansion."

— **Simona Carini,** Open mHealth Data Scientist

The Impact

≫ In presentations created since the publication of DiMe's Sensor Data Integrations resources, Carini has referenced the Library of Standards to show that Open mHealth-initiated IEEE P1752.1 ™, one of the listed standards, is part of a landscape of standardization initiatives.
