FIRST OPINION

DiMe: Calling all who serve in digital medicine

By JEN GOLDSACK, BEAU WOODS, and ERIC PERAKSLIS / JUNE 5, 2019

Source:https://www.prnewswire.com/news-releases/digital-medicine-society-now-accepting-members-300848402.html and https://www.statnews.com/2019/06/05/new-digital-medicine-society/

… and sit at the intersection of two communities

Source: https://www.dimesociety.org/index.php/about-us-main

We deliver clinical quality work on a tech timeline

New knowledge & capabilities in the field spark new collaboration opportunities

Communication & education

Resources & publications generated by DiMe & thought leaders in the field are exchanged between various stakeholders & across the many disciplines in the field.

Community

DiMe members, partners, & experts from across tech & healthcare unite to collaborate & identify ways to overcome barriers to success.

Actionable, evidence-based resources

Greatest challenges & opportunities to advancing the field

Research

Experts from across all disciplines address shared challenges through deep inquiry & data generation, creating actionable, evidence-based resources.

V3 is a modular evaluation process

Design Specifications & Modular Prototyping

Verification

Evaluates and demonstrates the performance of a sensor technology within a **BioMeT** , and the sample-level data it generates, against a pre-specified set of criteria.

Analytical validation

Evaluates the performance of algorithm, and the ability of this component of the **BioMeT** to measure, detect, or predict physiological or behavioral metrics

Clinical validation

Evaluates whether a **BioMeT** acceptably identifies, measure, or predicts a meaningful clinical, biological, physical, functional state, or experience, in the states context of use (which includes a specified population).

Clinical Utility

BioMeT - Biometric Monitoring Technology

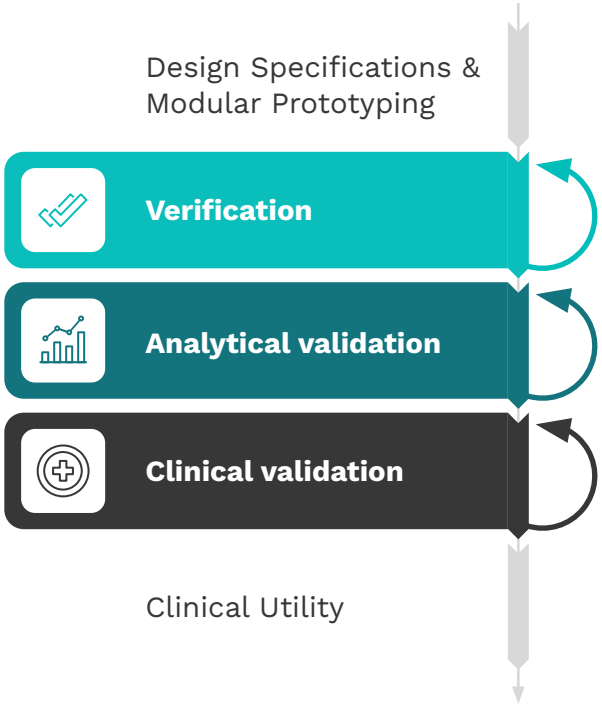
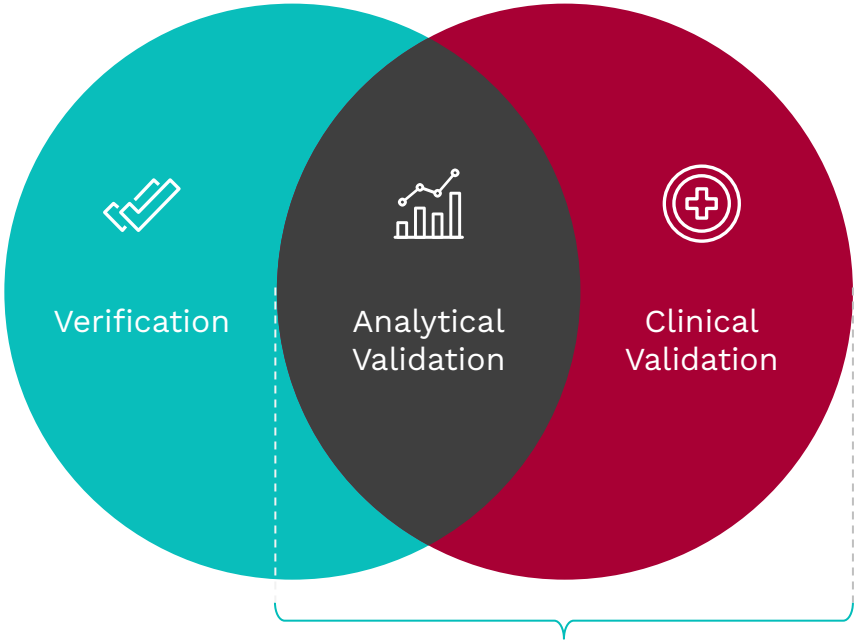
Modular evaluation of digital measures



Changes to hardware/firmware?	• Reverification, or • Documentation of back-compatibility
Changes to software that change algorithm?	• Repeat analytical validation, or • Documentation of back-compatibility
Expansion to a new patient population?	• Repeat clinical validation if analytical validation in new population is documented, or • Repeat analytical & clinical validation

Source: https://www.nature.com/articles/s41746-020-0260-4

V3 processes are typically conducted by experts across disciplines and domains



Activity performed by:

(non-clinical) engineers

Both engineers and clinically-trained professionals

Clinically-trained professionals

Adoption of the V3 framework

The V3 Framework is emerging as the industry standard for evaluating DHTs:

- **Cited over 120 times** in the scientific literature
- Foundational to **EMA** and **NIH** perspectives and recommendations
- Aligned with **FDA** guidance

Determine Fit for Purpose: V3 Framework

Verification → Sensor performance verification against a reference shake table

Analytical Validation → Algorithm performance versus a benchmark, human rater to measure time and number of steps

Clinical Validation → Relationship with conventional outcomes and assessment properties

Case study

- walk duration
- walking distance
- number of steps
- walking speed
- stride period

Adopted from: npj Digital Medicine (2020) 3:55 ; https://doi.org/10.1038/s41746-020-0260-4

Why Sensor Verification Is Important?

Sensor Verification

- Fit for purpose principle is always context of use dependent
- Context of use is often different than original intended use of a selected technology/ device
- Needs to be established regardless of regulatory status of a technology/ device
- Access to sample level data is critical

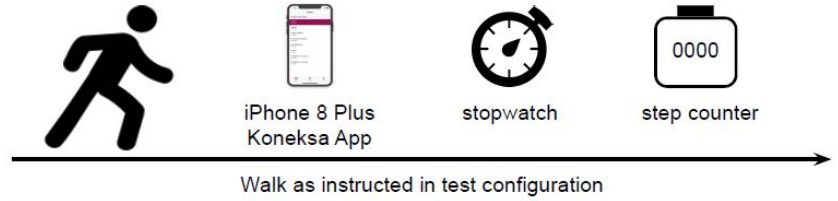
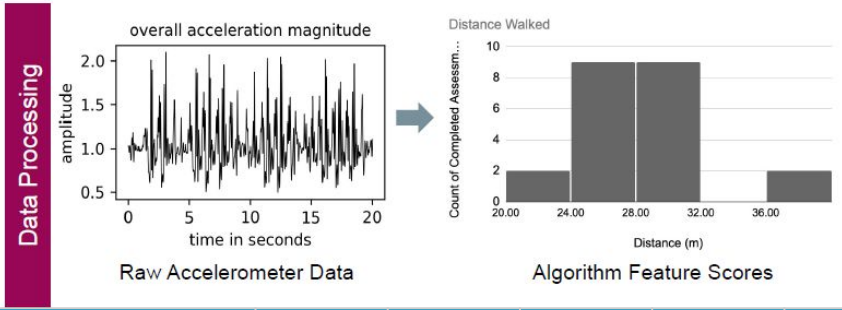
Peter Kelly, Chengrui Huang, Robert Ellis. Comparison of Accelerometers Used for Measurement of Upper Body Postural Tremor, and Gait and Balance. Movement Disorder Society 2020; 35 (suppl 1). MDS Virtual Congress 2020. Abstract # 1415.

Analytical Validation of Algorithm in Human Subjects

Analytical Validation

- Can be performed in healthy population
- Benchmark can include a human rater or a device
- May require multiple iterations for algorithm optimization
- Testing for operational tolerance may be required
- Publicly available algorithms need to undergo the same procedure





Assessment	Duration (s)	Distance (m)	Steps (count)	Speed (m/s)	Stride Period (s)
Analytical Validity (combined results for 5s, 10s, 15s, 20s walk)	0.989	0.987	0.992	0.764	0.593
Operational Variation (Loose Pocket)	N/A 20s walk of fixed duration	0.850	0.868	0.741	0.850
Operational Variation (Shoulder Bag)		0.932	0.858	0.837	0.798

Development of an Algorithm for the Evaluation of Gait and Balance Impairments in CNS Disorders.

Sensor Verification and Analytical Validation of Algorithms to Measure Gait and Balance and Pronation/Supination in Healthy Volunteers

Robert Ellis, Peter Kelly, Chengrui Huang, Andrew Pearlmutter and Elena S. Izmailova *

Koneksa Health, New York, NY 10038, USA
* Correspondence: elena@koneksahealth.com

Abstract: Numerous studies have sought to demonstrate the utility of digital measures of motor function in Parkinson's disease. Frameworks, such as V3, document digital measure development: technical verification, analytical and clinical validation. We present the results of a study to (1) technically verify accelerometers in an Apple iPhone 8 Plus and ActiGraph GT9X versus an oscillating table and (2) analytically validate software tasks for walking and pronation/supination on the iPhone plus passively detect walking measures with the ActiGraph in healthy volunteers versus human raters. In technical verification, 99.4% of iPhone and 91% of ActiGraph tests show good or excellent agreement versus the oscillating table as the gold standard. For the iPhone software task and algorithms, intra-class correlation coefficients (ICCs) > 0.75 are achieved versus the human raters for measures when walking distance is >10 s and pronation/supination when the arm is rotated more than two times. Passively detected walking start and end time was accurate to approx. 1 s and walking measures were accurate to one unit, e.g., one step. The results suggest that the Apple iPhone and ActiGraph GT9X accelerometers are fit for purpose and that task and passively collected measures are sufficiently analytically valid to assess usability and clinical validity in Parkinson's patients.

Keywords: technical verification; analytical validation; accelerometer; gait and balance; walking; pronation; Parkinson's disease

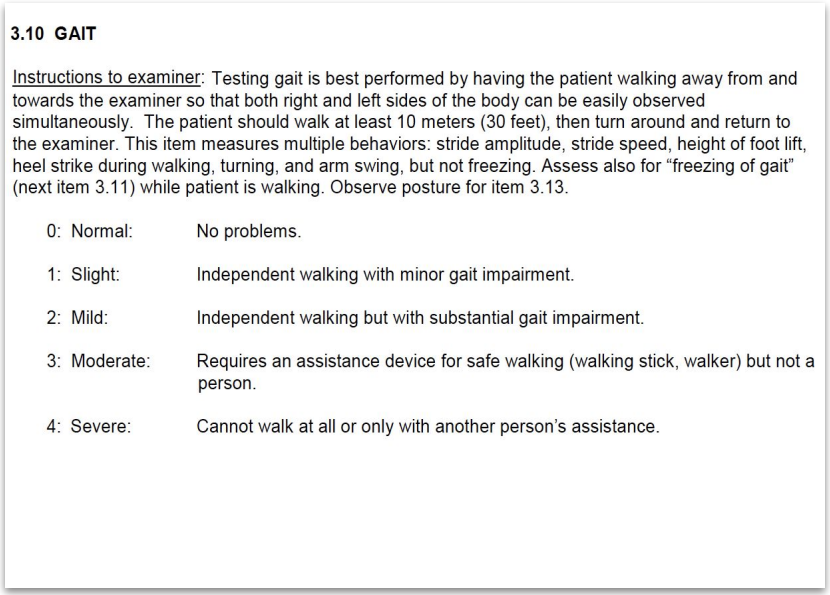
Clinical Validation Is Not the Whole Story

Clinical Validation



3.10 GAIT

Instructions to examiner: Testing gait is best performed by having the patient walking away from and towards the examiner so that both right and left sides of the body can be easily observed simultaneously. The patient should walk at least 10 meters (30 feet), then turn around and return to the examiner. This item measures multiple behaviors: stride amplitude, stride speed, height of foot lift, heel strike during walking, turning, and arm swing, but not freezing. Assess also for "freezing of gait" (next item 3.11) while patient is walking. Observe posture for item 3.13.

0:	Normal:	No problems.
1:	Slight:	Independent walking with minor gait impairment.
2:	Mild:	Independent walking but with substantial gait impairment.
3:	Moderate:	Requires an assistance device for safe walking (walking stick, walker) but not a person.
4:	Severe:	Cannot walk at all or only with another person's assistance.

Clinical Validation
Relationship with conventional **clinical outcomes** in addition to:
Construct Validity convergent and known group validity of new measures versus existing validated measures
Responsiveness: sensitivity to change and responder analysis over relevant timescales
Reliability: test-retest reliability of measures, reliability of devices

+

Usability, Safety and Face Validity
Usability: can patients perform data collection procedures independently and navigate technology-related apps?
Safety: can patients safely use the digital instrument?
Multi site operational tolerance: can site staff and patients operate the instrument successfully and routinely with high compliance in a clinical study setting?
Face validity: how the data behaves overall and whether it can be interpreted in the context of a chosen indication?

Case Study 2: Clinical Validation of a Digital Health Technology

Clinical Validation of Portable EEG

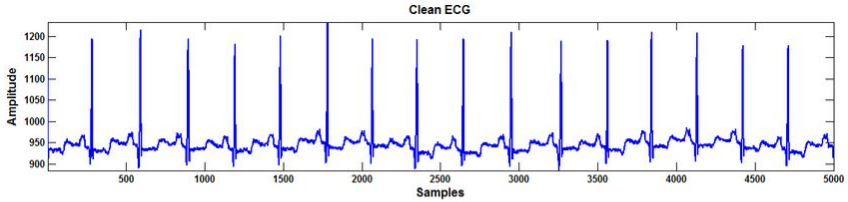
Study: Wake and Sleep State Transitions on a Portable Electroencephalogram (EEG) Device in Narcolepsy Patients and Healthy Participants

- Validation
  - Concordance of sleep state scoring
  - Correlation of sleep transitions
  - *In-clinic comparison to gold standard PSG*
- Digital Biomarker
  - Night to night variability in sleep patterns
    - Sleep transitions
    - Healthy vs Narcolepsy
  - *At-home data (portable EEG only)*
- Patient population: Healthy and Narcolepsy patients

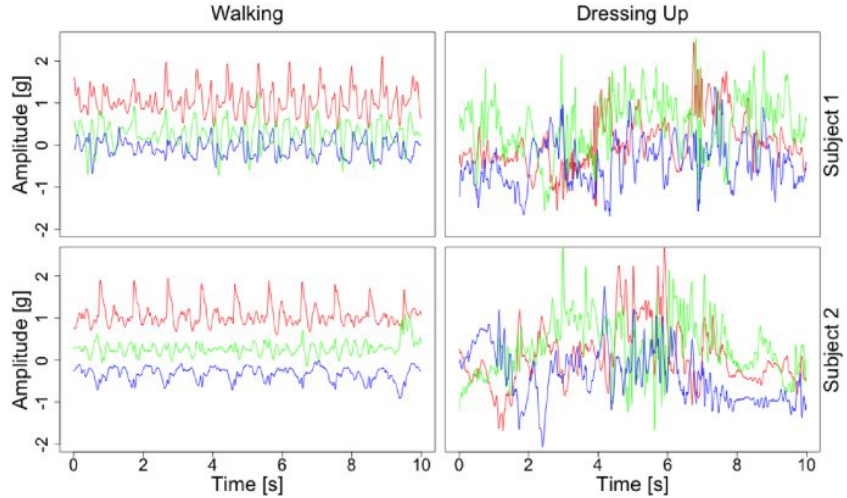
https://en.wikipedia.org/wiki/Epilepsy#/media/File:Spike-waves.png

Digital Devices

- Portable EEG system
  - Lightweight and designed for nighttime use
- Portable ECG system (exploratory)
  - Chest patch for continuous at-home wear
- Accelerometry (exploratory)
  - Wrist-worn actigraphy for additional metrics
  - Activity level, intensity, rest, sleep
- ePRO
  - Sleep quality
  - Narcolepsy symptoms

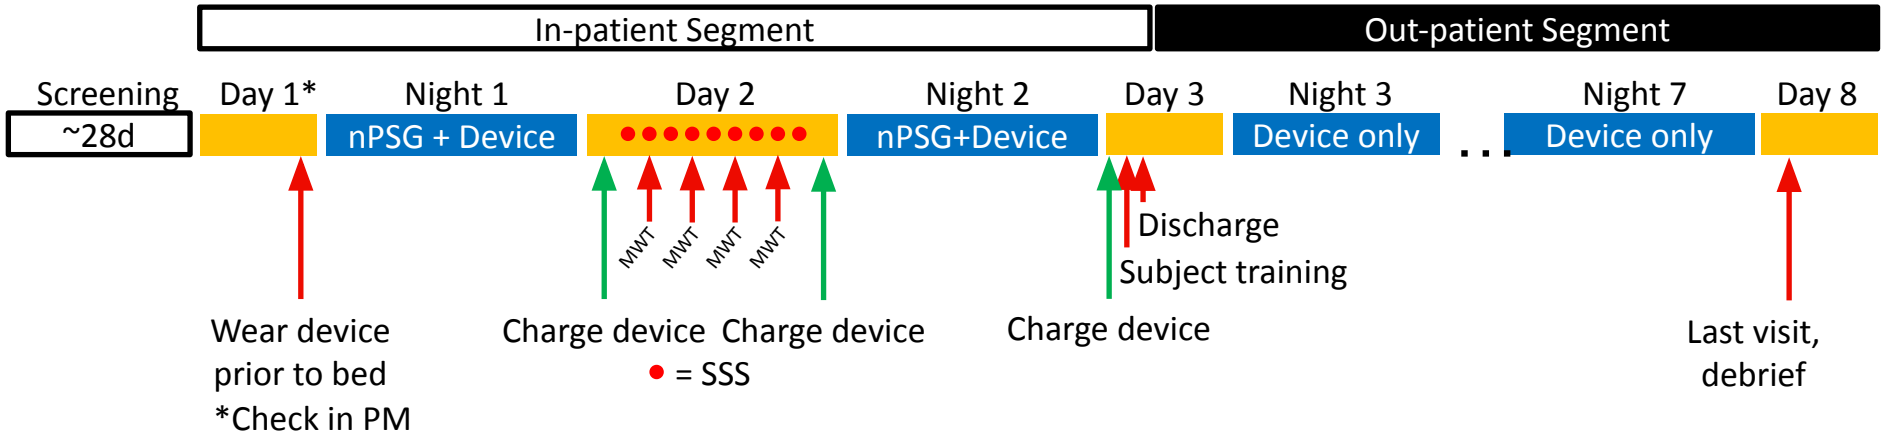


Mohan, N et al. (2016). Modified Variational Mode Decomposition for Power Line Interference Removal in ECG Signals. International Journal of Electrical and Computer Engineering (IJECE). 6. 151



Karas, M et al. (2018). Accelerometry Data in Health Research: Challenges and Opportunities: Review and Examples

Study Design



1. Study will include 16 people with narcolepsy and 16 age/gender matched healthy controls
2. Digital devices include night-time EEG, 24/7 accelerometry and ECG monitoring, and ePRO diary
3. 2 nights of in-patient testing to enable testing EEG device against gold-standard nPSG
4. 5 nights of out-patient testing for at-home use of digital devices
5. Subjects will keep an ePRO diary for sleep quality as well as narcolepsy symptoms

Expected Outcome of Validation Study

- Determine if portable EEG is fit-for-purpose (clinical validation)
  - Narcolepsy patient population
- Digital Biomarker: sleep transitions
  - Can biomarker be measured at home
- Operational experience with digital devices
  - Build confidence across functional groups
- Results presented at Sleep 2022 conference in Charlotte, NC
  - Max Tolkoff, PhD

https://myfulfillmentcompany.com/operational-expertise/

Overall Message

- V3 framework: modular evaluation of digital measures
  - Verification
  - Analytical validation
  - Clinical validation
- Analytical validation: algorithmic performance against a gold standard
  - Takeda study: Withings ecosystem of devices
- Clinical Validation: does the DHT accurately measure a meaningful outcome metric for the specific patient population
  - Portable EEG system to measure sleep parameters remotely in patients with narcolepsy

Successful use of the V3 framework will demonstrate that your DHT is fit-for-purpose
