But first, housekeeping

- Please note: **today's session is being recorded**
 - Slides and recording will be available on DiMe's webinar page after the session
- To ask a question for discussion during live Q&A, please either:
 - **'Raise your hand'** in the Reactions and the moderator will unmute you to ask your question live, or
 - **Type your question** into the chat box

**** Participants are not permitted to transcribe this webinar, violators will be removed from the session.*

V3+ evaluation of digital clinical measures

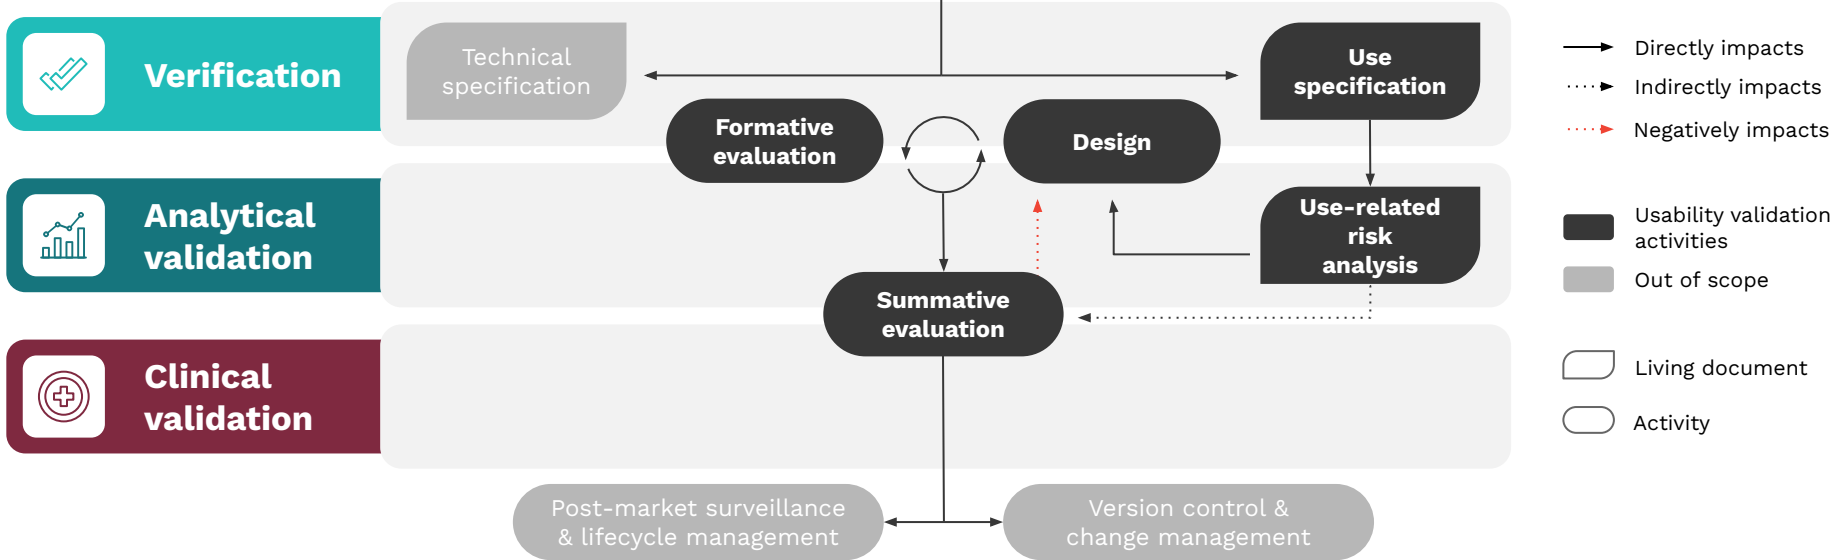

For sDHTs that are under development (pre-market), begin by developing a proposed intended use statement

- What** does the sDHT do?
- Who** are the intended users?
- Where** should the sDHT be used?
- When** should the sDHT be used?
- How** should the sDHT be used?

The **intended use statement***, which describes the specific clinical circumstance or purpose for which the sDHT is being developed and includes the indications for use, guides subsequent activities

**Note: The intended use statement is a key component of the labeling of regulated medical devices. An equivalent statement should be developed for non-regulated sDHTs.*

Let's start with verification

**The
verification
process
answers two
important
questions...**

Is my sensor fit-for-purpose?

01

Is my sensor good or garbage?

02

Important concepts in verification

Sample-level data

Sample-level data refers to output data at the sample level from the sensor itself. It is a construct that holds clear and consistent meaning across all sDHTs. We prefer to use this term instead of “raw data,” which is often used to describe data existing in an early stage of the data supply chain and is often inconsistent across different technologies.

Performance goal

Performance goals are precisely defined and easily testable objectives that a sensor should meet to achieve the desired outcome. They are typically established by the manufacturer, based on the intended use of the technology, or by community standards for other familiar technologies.

Where can you find evidence of verification?

Performance specifications for the integrated hardware

Output **data specifications**

Overview of **software system tests**

Limitations to the verification testing, e.g., specific known items that were not tested during verification

Next, let's discuss usability validation

**The usability
validation
process
answers one
important
question...**

Can the sDHT be used to achieve specified goals with ease, efficiency, and user satisfaction, within the stated intended use which includes a description of all intended users?

01

Important concepts in usability validation

Use specification

- The intended use statement has a direct impact on the **use specification** of an sDHT. The use specification is a comprehensive description of who the intended sDHT user groups are; where, when, and how each user group will interact with the sDHT; and their motivations for doing so.

Critical tasks

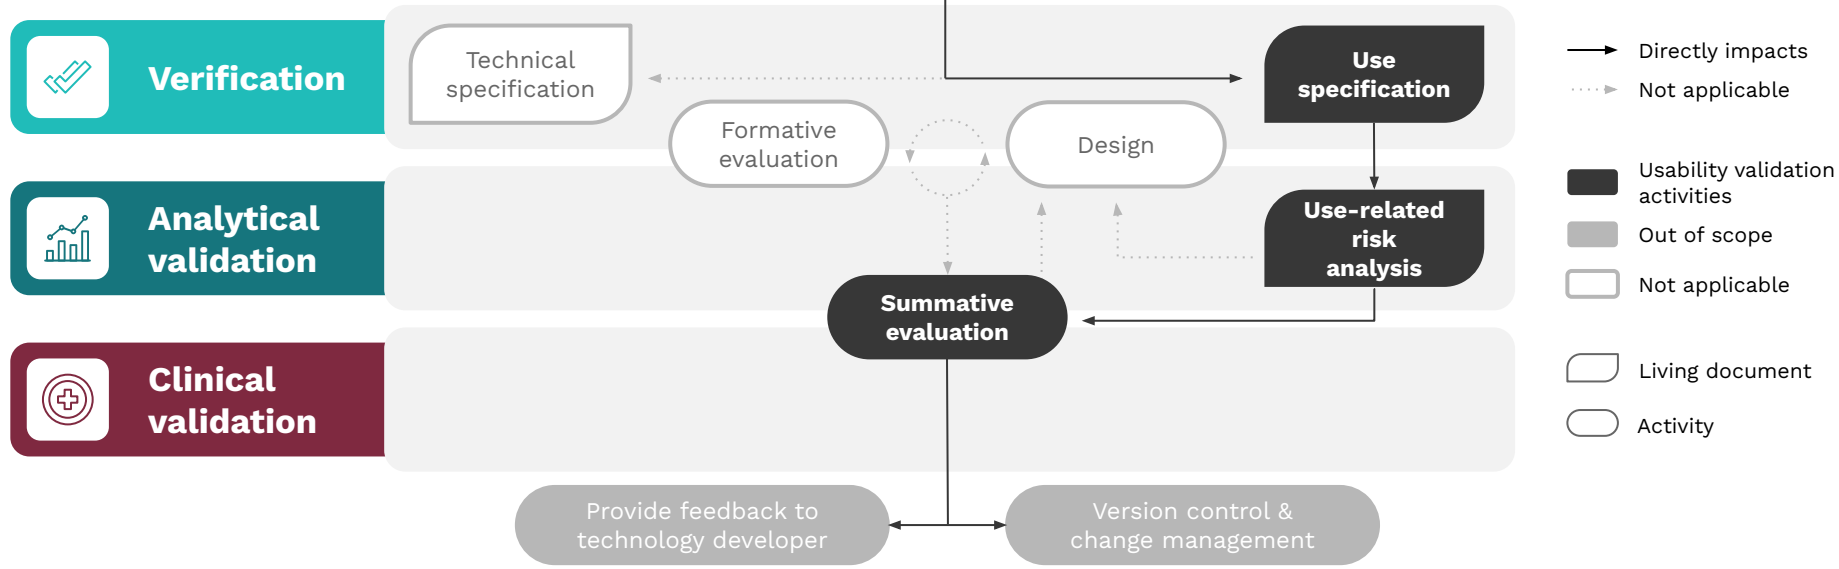

- Critical tasks are user tasks that when not performed, or if performed incorrectly, would or could lead to **serious harm**.

For sDHTs that are commercially available (post-market), begin by developing a proposed context of use statement

- What** will the sDHT be used for?
- Who** are the intended population(s) of interest?
- Where** will the sDHT be used?
- When** will the sDHT be used?
- How** will the sDHT be used?

The **context of use statement*** fully and clearly describes the way the sDHT is to be used and the purpose of the use

**Note: The context of use should be compared against the original intended use of the sDHT; this gap analysis will guide subsequent activities.*

Where can you find evidence of usability validation?

Documentation of studies should include:

- Use specification
- Use-related risk analysis
- Regulatory submission (if applicable)

Summative study protocols, study reports and white paper and/or **Peer-reviewed manuscript** should also be made publicly available.

The **Institutional Review Boards' (IRBs) or Ethics Committees' (ECs) documentation** for the summative study should also be provided.

Now, let's move on to analytical validation

The analytical validation process answers three important questions...

How well does the algorithm perform in a potential target population?

01

Does the sDHT really measure the clinical concept it claims to measure as defined by a reference measure?

02

Can the algorithm acceptably measure, detect, or predict a clinical condition when that algorithm is applied to data captured by a verified sensor in accordance with a specific protocol in a particular population?

03

Important concepts in analytical validation

Reference measures for analytical validation

Algorithms that process sensor-generated data can create metrics that are behaviorally or physiologically meaningful, such as oxygen saturation, heart rate variability, or gait velocity. The metric produced by the algorithm must be evaluated against an **appropriate reference measure**; for example, oxygen saturation should be measured against a lab analysis of arterial blood samples, heart rate variability against electrocardiography, and gait dynamic against motion capture systems.

The best practices for choosing reference measures for analytical validation and avoiding poor methodological approaches should be **agreed upon and documented**. Guidance documents, consensus statements, and/or the peer-reviewed literature should be referred to as needed.

Where can you find evidence of analytical validation?

Description of analytical validation studies conducted according to the requirements of Good Clinical Practice (GCP). This description can be in any one or more of the following forms:

- Internal documentations
- Regulatory submissions (e.g., 510(k)s)
- White papers
- Published journal article

Documentation for every algorithmic output of system should include:

- Description of the output metric
- Overview of **how the metric was calculated**, including specific details where possible
- Which reference **measure** was used as the comparator to validate the metric
- **Results from a direct comparison** between calculated metric and reference measure, including statistical analysis methods
- Description of the **human subjects** population, experimental conditions, and protocol used in the aforementioned direct comparison testing

If this validation testing was undertaken as part of a clinical trial with human participants, then the **Institutional Review Boards (IRBs)** or **Ethics Committees (ECs)** documentation should also be provided.

Lastly, let's discuss clinical validation

The clinical validation process answers two important questions...

Can a sensor-derived outcome measurement that has undergone verification, usability validation and analytical validation be used to answer a specific clinical question?

01

Are the data clinically meaningful in the stated context of use?

02

PRO TIP

Clinical meaningfulness of the measure needs to be established **before** technology selection

This applies regardless of whether a digital clinical measure is being used to support *clinical research*, *clinical care* or *public health*.

SPOTLIGHT

When an **existing clinical measure** is being digitized, clinical validation has mostly been completed.

Example: **Blood pressure**

It's well known that blood pressure is important; we don't need to prove it just because we're using a digital tool to measure it.

When a **clinical measure is novel** or being captured in a new environment, much **more** comprehensive clinical **validation is needed.**

Example: **Blood pressure at home**

The screenshot shows the top portion of a journal article page. At the top, the journal title "Journal of the American Heart Association" is displayed in a red banner, with "OPEN ACCESS" and a lock icon to the right. Below the banner, the journal's logo is visible. The article title is "Magnitude of the Difference Between Clinic and Ambulatory Blood Pressures and Risk of Adverse Outcomes in Patients With Chronic Kidney Disease". The authors listed are Elaine Ku, MD, MAS; Raymond K. Hsu, MD, MAS; Delphine S. Tuoi, MDCM, MAS; Se Ri Bae, BA; Michael S. Lijpkowitz, MD; Miroslaw J. Smogorzewski, MD, PhD; Barbara A. Grimes, PhD; and Matthew R. Weir, MD. The page also includes the journal's ISSN (e011013), the publication date (May 7, 2019), and the PMCID (PMC6512117).

Where can you find evidence of clinical validation?

Documentation of studies should include one or more of:

- Clinical study report (CSR)
- Regulatory submission (FDA or EMA)
- Published conference proceeding
- Published journal article

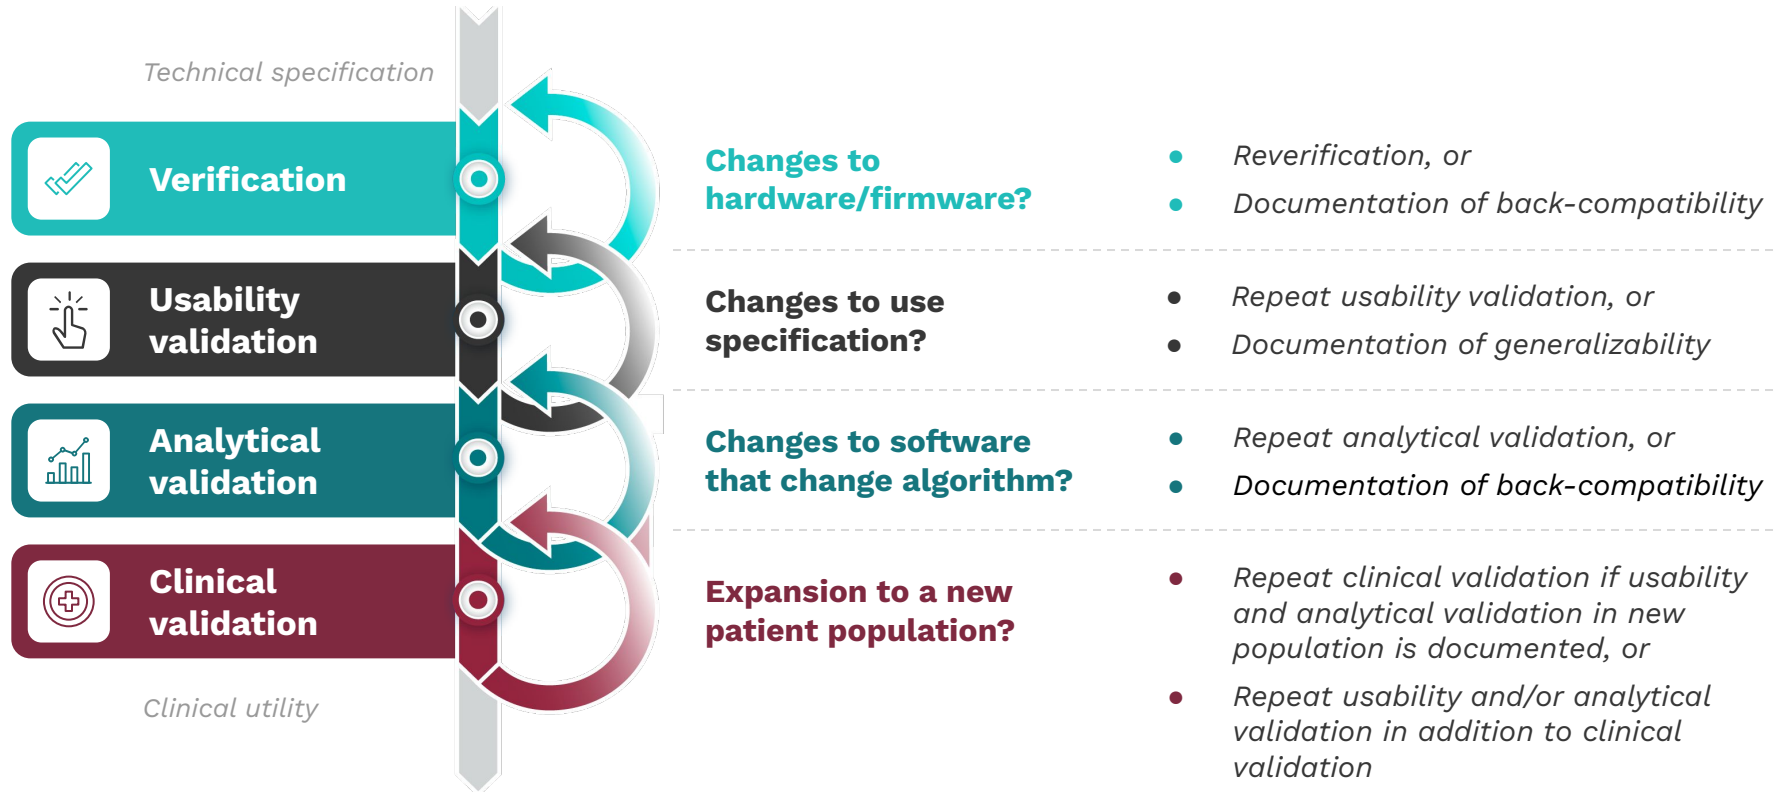

Protocols and **study reports** should also be made publicly available.

The **Institutional Review Boards'** (IRBs) or **Ethics Committees'** (ECs) **documentation** for the study should also be provided.

Accelerating
Digital
Measures

A DEEP enabled collaboration to advance validation and qualification of digital measures

Tuesday June 18, 2024

John Batchelor, Science Liaison
john@deepmeasures.health

What is DEEP?

DEEP Accelerates Digital Measure Development

EUROPEAN MEDICINES AGENCY
SCIENCE MEDICINES HEALTH

CLINICAL TRIALS
TRANSFORMATION
INITIATIVE

cdisc

NATIONAL CANCER INSTITUTE
Center for Biomedical Informatics
& Information Technology

ISPOR
Improving healthcare decisions

DEEP is built with input from cross-stakeholder experts and integrates several relevant standards and best practices into a single tool

DEEP

Understand the disease or condition
Conceptualize clinical benefit
Define measures & standards
Evaluate measurement properties
Interpret meaningful change
Engage in dynamic regulatory review

The DEEP Stack model and cloud platform provide a structured validation blueprint and simplified process that developers of patient centred digital measures can follow.

Knowledge is findable, accessible, interoperable & reusable (FAIR). These principles allow structured evidence to support multiple qualification pathways.

How does DEEP support new ways of working

DEEP simplifies the development and qualification process for digital measures

Academia

PPP's

Regulators

Pharma

Patients

Tech

Payers

HTA bodies

Builds transparency and alignment between multiple stakeholders, fostering collaboration.

Enables content re-use and automation for more efficient development.

Promotes comparison and harmonization of digital measures that are meaningful to patients.

The DEEP-EFPIA pilot with the European Medicines Agency

Case study: Nocturnal scratch

Following the work started with the Digital Medicines Society (DiMe), a multi-stakeholder applicant consortium including 7 Pharma companies partnered with DEEP and EFPIA to participate in the pilot and seek EMA regulatory advice for:

- Nocturnal Scratch as a measurable concept
- Using a technology standard for measuring Nocturnal Scratch to validate new or updated Digital Measurement Solutions, and
- Extendability of the evidence for Nocturnal Scratch in Atopic Dermatitis to Psoriasis.

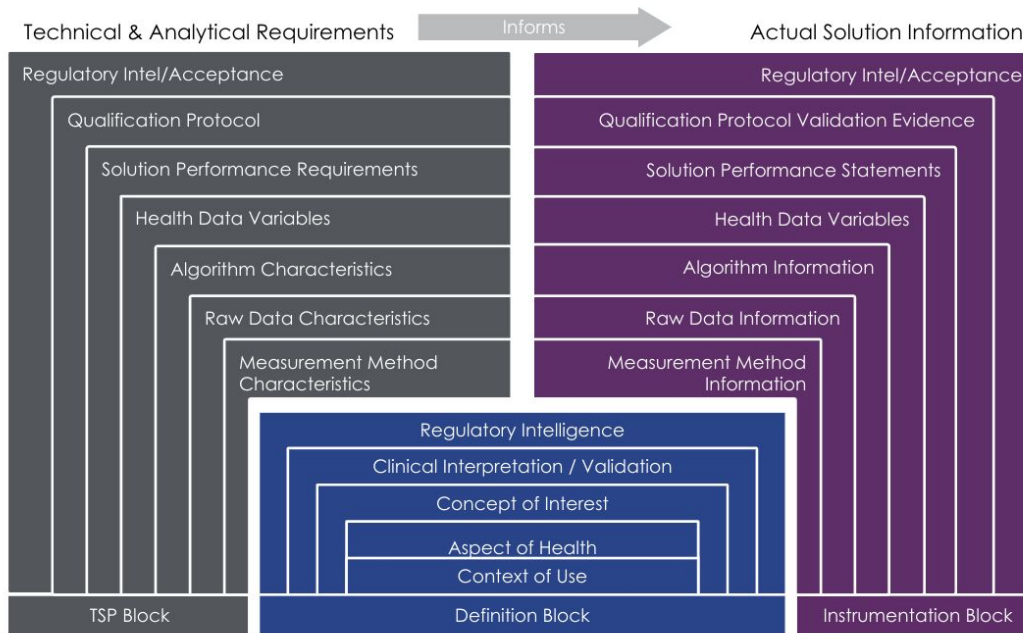

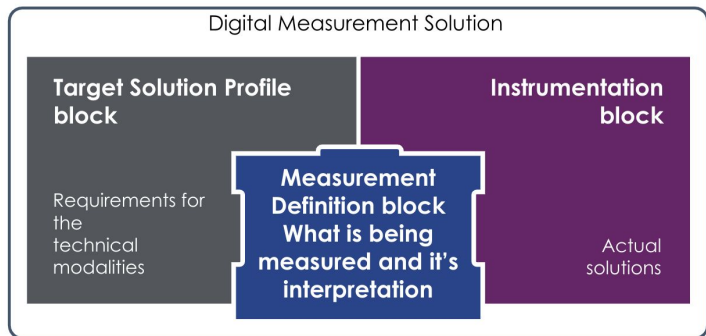

Final ITF meeting notes are available at www.deepmeasures.health/nocturnalscratch

The Stack Model

Each block within the stack has several layers that have individual re-use and harmonization potential.

This is an efficient and scalable way to structure information and enable network effects to accelerate the ecosystem.

The DEEP **stack model** enables **standardisation** and **re-use** of digital measure components

Concept of interest (COI) view - Measurement Definition Block

The screenshot displays the 'Nocturnal Scratch' Measurement Definition Block in the DEEP Creator application. The interface includes a top navigation bar with 'Missions', 'Catalogue', 'Help', and 'Applicant 1 DEEP Creator' options. A left sidebar contains a navigation menu with 'Concepts of Interest' highlighted. The main content area is divided into sections: 'Nocturnal Scratch' (with a description), 'Measurement Variables' (a table with 2 rows), 'Measurement Definitions' (a table with 1 row), and 'Assigned References' (a table with 1 row). A right sidebar contains 'Access' (Open to all DEEP users), 'Tags' (scratch), and 'Other Information' (Curation Workflow Status: In Progress, Maturity Status: Defined, Regulatory Acceptance: No Acceptance, Interests you have access to: Digital Measurement Development..., A discovery mission to understand..., Missions you have access to).

Nocturnal Scratch

An action/behaviour, of rhythmic and repetitive skin contact movement performed during a delimited time period of intended sleep.

Measurement Variables

Name	Description and measurement of change
Total Scratch Time	Sum of all scratch bouts measured during a delimited measured period of intended and actual sleep within the total sleep opportunity.
Frequency of Scratching	Counts of the number of scratch bouts measured during a delimited measured period of intended and actual sleep within the total sleep opportunity.

Measurement Definitions

Name	Description
Nocturnal Scratch in Atopic Dermatitis

MAH and COI definitions are tied with evidence to the context of use via the Measurement Definition block.

Target Solution Profile (TSP) view

Actigraphy-based measurement of Nocturnal Scratch.

A set of requirements that define standard for actigraphy-based measurement of Nocturnal Scratch in the case of Atopic Dermatitis for patients and caregivers whose Quality of Sleep is compromised.

Measurement Definitions

Name	Description
Nocturnal Scratch in Atopic Dermatitis	

Target Solution Profiles

Measurement Method

Name	Description	Type
Device orientation	Detection must account for device orientation to account for angular velocity and gesture recognition for low amplitudes motion such as finger scratches.	Essential
Time of day	Detection must account for the time-of-day to capture the 'night-time intend to sleep' period to define the nocturnal scratch more precisely.	Essential
Scratch and Sleep	Detection must be objective assessment of both nighttime scratch and sleep.	Essential
Spontaneous Scratches	Detection must be able to account for spontaneous scratches.	Essential

Technical, analytical and usability standards (incorporating V3+ etc..)

Raw Data

Name	Description	Type
Sampling Frequency	Sampling rate must comply with threshold limits of greater than or equal to 20Hz.	Essential

Algorithm

Name	Description	Type
Resolution	Minimum resolution of 12bits, corresponding to approximately 3.9mg with stipulated dynamic range requirement.	Essential

Health Data Variables

Name	Description	Type
No data added yet		

Solution Performance Requirements

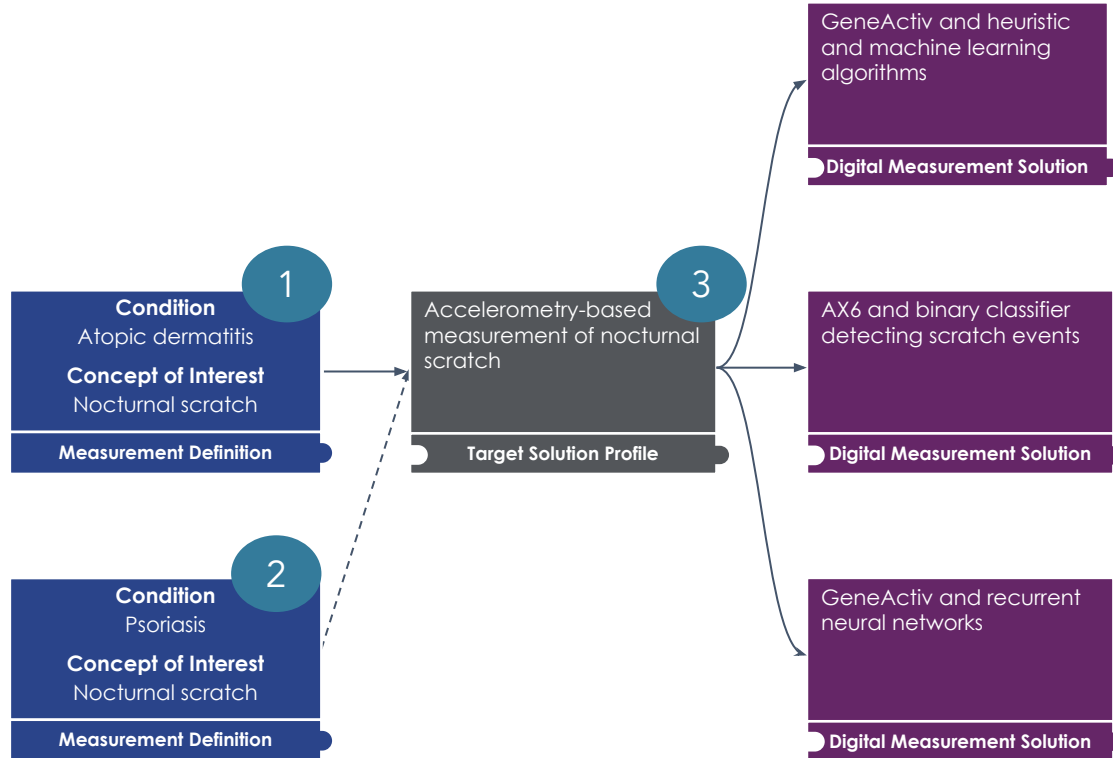

Name	Description	Type
Monitor for breach	Ensure data is secure at rest and transit. Make sure monitoring practices for breach are in place during data acquisition, transfer, and storage.	Essential
Measurement continuity	Data must represent continuous sampling.	Essential

Qualification Protocol

Name	Description
------	-------------

Catalog in the ITF Procedure

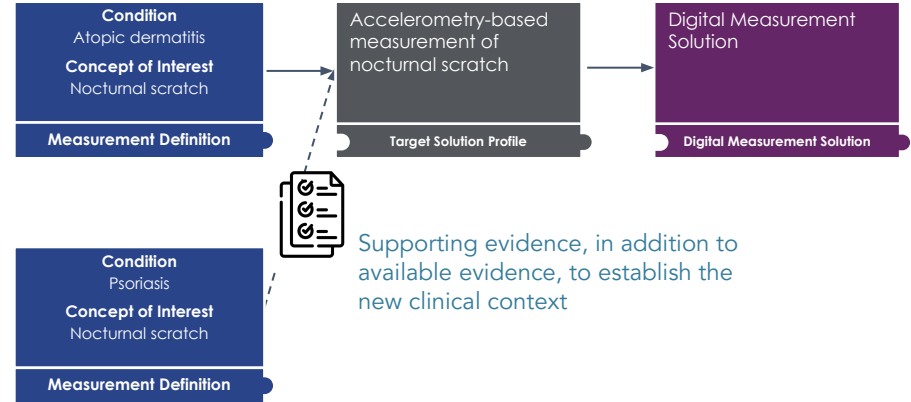

The Catalog provided structured evidence for the Questions in the Briefing Document focused on

1. Body of Evidence
Need for Regulatory validation of Nocturnal Scratch Measure
2. Development of new definition block for Psoriasis
3. Development of a new instrument block for current target solution profile (TSP)

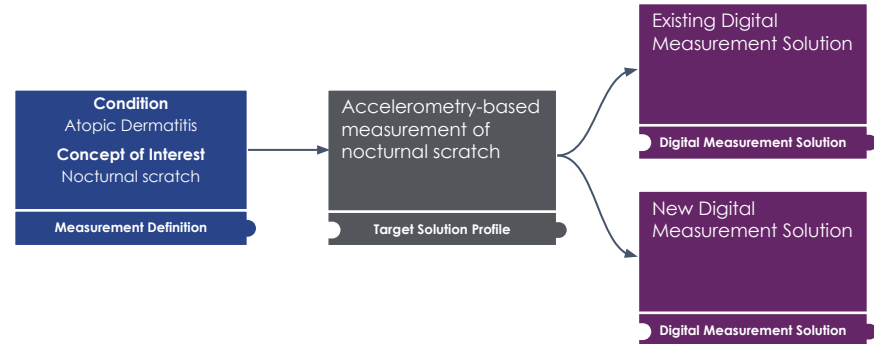

Key Scenarios for Re-Usability

Scenario 1:
Extending the Measure to another
Condition

Scenario 2:
Developing a new instrument block for
current target solution profile (TSP)

Pilot learnings from ITF feedback and future applicability

Exploratory Components

Collaboration

Standards for validation

Content lifecycle management

Targeted regulatory engagement

Re-use cases: DHT and CoU

What happens after the pilot?

Test on a full qualification procedure on a digital endpoint using the DEEP model across Contexts of Use

DEEP to continue developing the platform informed by the learnings of the pilot

Conducting pilots with other key stakeholders (Notified Bodies, other Agencies, HTAs)

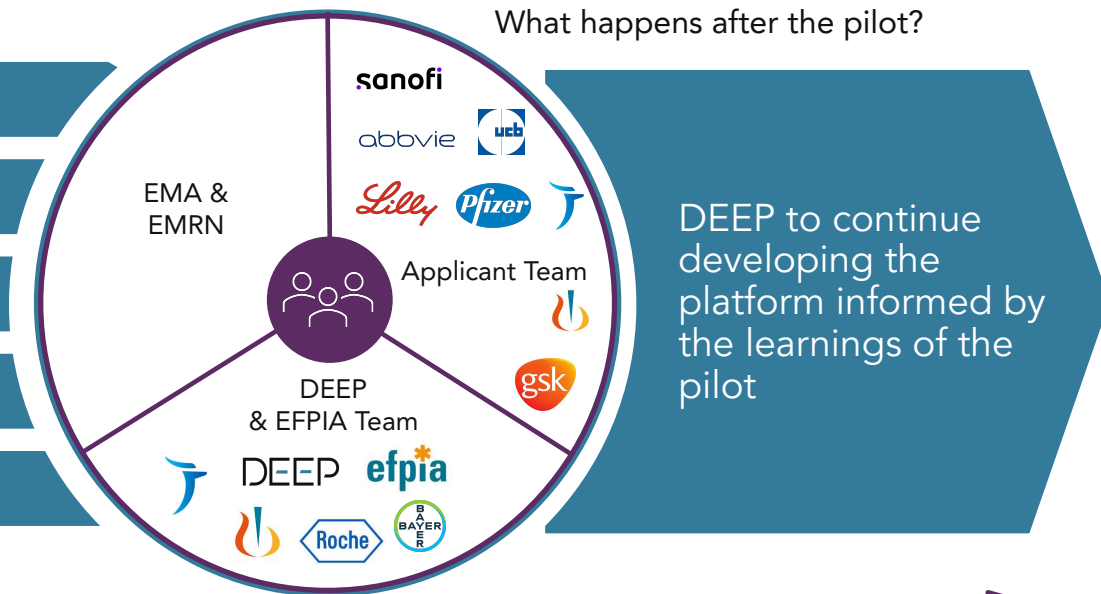

Feedback from participants

Structured approach has the potential to increase the quality of evidence submitted

Reuse of evidence for new conditions showed large potential

Technology agnostic digital endpoint development is appealing

Pilot on a real use case provided feedback for further development

From promise to reality for the digital measures field

What can each stakeholder do to accelerate arriving at the plateau of productivity?

Collaboration

Meaningfulness and patient centricity

Validation and data standards

Regulatory acceptance

Re-use of evidence

Life-cycle management

Public Workshop
